Save time and money with EIT Inspection Tables from EAS

The answers to the most asked questions:

- Simple and safe to operate for staff
- Reduction of workload
- Time-saving solution for its quick operation
- Space-saving by storing molds simply

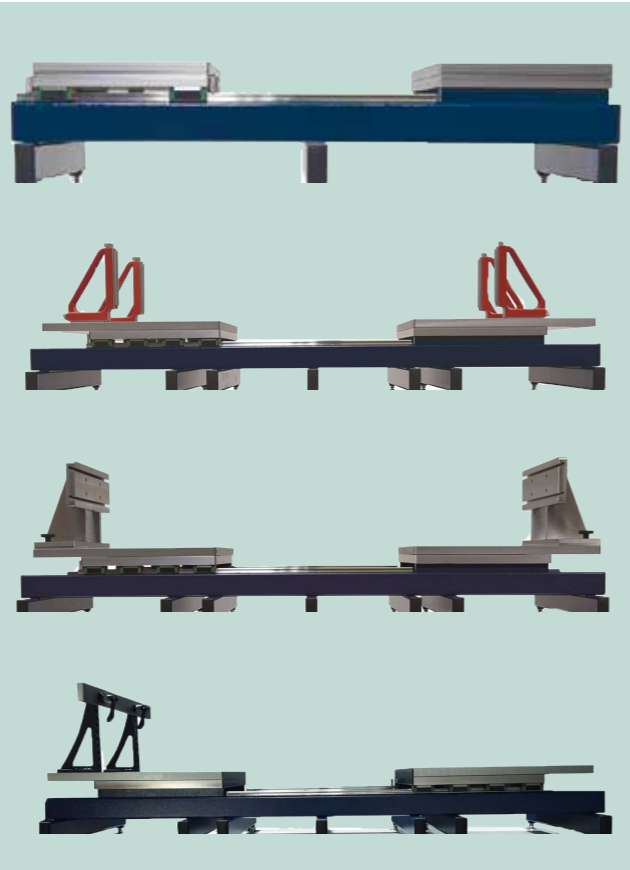

Why EAS change systems?

The EAS mold care program covers mold handling from storage to transport on site to loading and unloading of the machine. Automated and carefully guarded, the solutions range from mold change tables, inspection and maintenance units to pre-heating and mold rotating equipment.

The flexibility gained in your changeover, will allow you to reduce inventories due to flexible production and thus secure the future of your company and your employees.

EAS offers different solutions, not only for keeping a mold in excellent condition but also for optimizing changeover procedures in general.

With a well-maintained mold, which is kept in the best possible condition, you will not only get the best quality and longevity of the mold itself, but you will also achieve the shortest downtimes and safest turnovers. EAS offers a wide range of mold care solutions, in which the EIT inspection units play a major role, for molds ranging anywhere from 1,500 up to 6,000 kilograms.

EIT solution

EIT inspection units are very easy to operate. They offer one fixed and one movable platen and allow for a 360° rotation of the movable platen. Positions can be locked to increase safety and brackets are available in three different versions: magnetic, mechanic and forged. Depending on the maximum weight of the mold and for each specific set up, EAS will help find the best solution.

Molds can be opened and closed in only a few seconds and all parts of the molds can be reached. So the advantages are not only found in the costs saved in reducing changeover time and improving longevity, they also include the reduction of the labor costs associated with tooling up. The inspection unit allows one operator to perform inspection, cleaning and repair, without any further assistance. There are several options possible to further increase safety and to integrate testing functions which can even be integrated into the controls.

Technical characteristics

SLIDE MOVING STANDARD TABLE 1.5T, 2T AND 3T WITH DRAWERBLOCKS

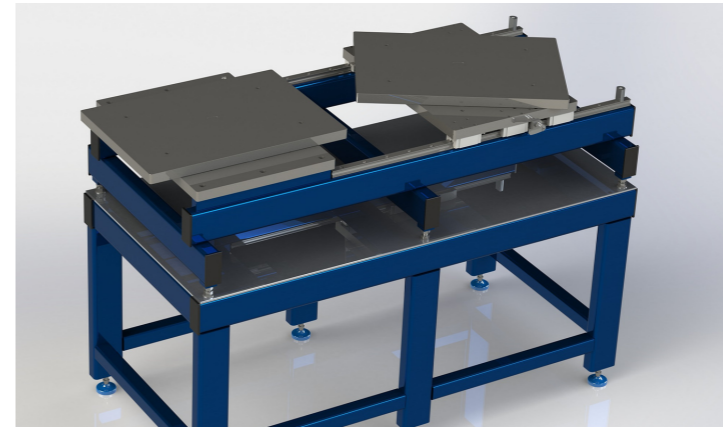

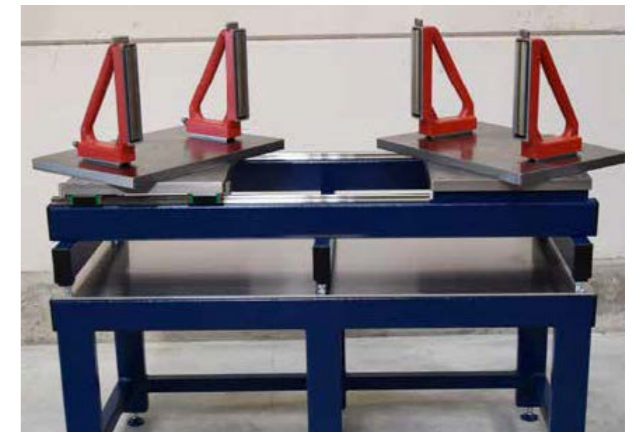

TABLE 6T XL MAGNETICAL BRACKET S

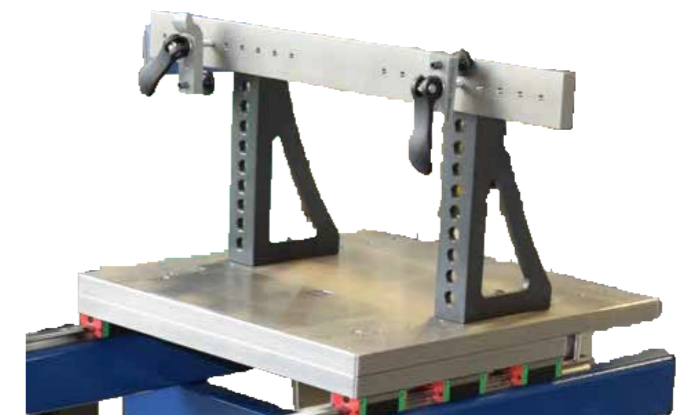

Max Load In KG	1500	2000	3000	6000
Standard	<ul style="list-style-type: none"> Ease of use, 1 fixed platen, 1 movable platen 360° rotation of the upper mobile platen Lockable positions for increased safety 			
Magnetic Brackets	<ul style="list-style-type: none"> Mold magnetic clamping system Allows free positioning on the plates Not appropriate for tools equipped with isolation plates 			
Mechanic Brackets	<ul style="list-style-type: none"> Mold mechanic clamping system Parallelism between bracket and mould 			
Forged Brackets	<ul style="list-style-type: none"> Ease of handling Flexible clamping Easy to use with a lighter bracket

Rotating tables

Magnetic clamping solutions are also available for multi-color rotating platen presses, and tie-barless molding machines. EAS offers other specialized applications for die-casting machines, rubber, and ceramic presses.

Horizontal mold change on injection molding machines

EAS also offers Pressmag clamping solutions for horizontal mold change operations. Horizontal clamping systems can be accompanied with time-saving rollers (driven and non-driven), mold-change tables, and transportation vehicles. Additional time saving options include multi-couplers and mold locking devices for standardized mold back plates.
